10    [I] Test Method

      (1) Administration of test compound and extraction of the  
          compound from brain

Male SD rats were given an i.v. injection of a solution  
containing a test compound (1 mg/kg). 5 Min later the

25    (2) h-NK<sub>1</sub> receptor binding assay

      (a) Crude CHO cell membrane preparation

CHO cells permanently expressing h-NK<sub>1</sub> receptors were  
30    harvested and homogenized with a Dounce homogenizer at 4°C in  
      a buffer (0.25 M sucrose, 25 mM Tris-HCl (pH 7.4), 10 mM  
      MgCl<sub>2</sub>, 1 mM EDTA, 5  $\mu$ g/ml p-APMSF). The homogenate was  
      centrifuged (500 x g, 10 min), and the pellet was resuspended  
      in the same buffer, homogenized, and centrifuged. The two  
35    supernatants were combined and centrifuged (100,000 x g, 1

hour). The crude cell membranes thus isolated were resuspended in a buffer (25 mM Tris-HCl (pH 7.4), 10 mM MgCl<sub>2</sub>, 1 mM EDTA, 5 µg/ml p-APMSF) and stored at -80°C until use.

(b) <sup>125</sup>I-BH-Substance P binding to the prepared membrane

Cell membranes (6 µg/ml) were incubated with <sup>125</sup>I-BH-Substance P (0.1 nM) with or without the extracted compounds in 0.25 ml of a medium (50 mM Tris-HCl (pH 7.4), 5 mM MnCl<sub>2</sub>, 20 µg/ml chymostatin, 40 µg/ml bacitracin, 4 µg/ml leupeptin, 5 µg/ml p-APMSF, 200 µg/ml BSA) at 22°C for 90 min. At the end of the incubation period, the contents were quickly filtered through a Blue Mat 11740 filter (pretreated with 0.1% polyethylenimine for 3 hours prior to use) by using SKATRON Cell Harvester. The filter was then washed with a washing buffer (50 mM Tris-HCl (pH 7.4), 5 mM MnCl<sub>2</sub>). The radioactivity was counted by using an auto gamma counter (Packard RIASTAR 5420A). All data presented are specific binding defined as that displaceable by 3 µM unlabeled Substance P.

[II] Test Result

All of the following Test Compounds showed more than 80% inhibition rate of <sup>125</sup>I-BH-Substance P binding to h-NK<sub>1</sub> receptors at the dose of 1 mg/kg.

B. Emesis in the ferret

[I] Test Method

Individually housed adult male ferrets (Marshall Farms, 1.4 to 2.2 kg) were given an i.v. injection of a solution containing a test compound. 30 Min later the emetic responses (retching and vomiting) were induced by administration of intra-gastric copper sulfate (40 mg/kg/ml) and observed for the next 30 min. The timing and number of retches and vomits observed were recorded for each animal. An individual animal was tested with at least 10 days between experiments.

[II] Test Result

All of the following Test Compounds showed 100% inhibition rate of emesis in the ferret at the dose of 1.0 mg/kg.

The following Preparations and Examples are given for the purpose of illustrating this invention.

#### Preparation 1

5 A mixture of 3-bromopyridine (6.25 ml), propargyl alcohol (4.9 ml), bis(triphenylphosphine)palladium(II) chloride (0.45 g) and copper iodide (125 mg) in triethylamine (100 ml) was stirred under reflux for 1.5 hours. After being cooled at room temperature, the reaction mixture was filtered and the insoluble material on the filter was washed with ethyl acetate (about 200 ml). The filtrate and the washing were combined and evaporated under reduced pressure. The resulting residue was purified by column chromatography on silica gel using a mixed solvent of hexane and ethyl acetate as eluent. The fractions containing the objective compound were collected and evaporated under reduced pressure to give 3-(3-pyridyl)-2-propyn-1-ol (7.9 g) as brownish crystals.

The residue was purified by column chromatography on silica gel using a mixture of ethyl acetate and n-hexane (4:6) to give (3R)-4-tert-butoxycarbonyl-3-(2,2-dibromoethenyl)-morpholine as an oil.

This oil was dissolved in tetrahydrofuran (15 ml) and butyllithium (1.62 M in hexane, 9.45 ml) was added to the solution at -78°C. After 30 minutes of stirring at -78°C, the mixture was quenched with water and extracted with ethyl acetate twice. The combined organic layer was washed with brine, dried over magnesium sulfate, and evaporated under reduced pressure. The residue was purified by column chromatography on silica gel using a mixture of ethyl acetate

and hexane (2:8) to give (3R)-4-tert-butoxycarbonyl-3-ethynylmorpholine (1.385 g) as a pale yellow oil.

of 3,5-bis(trifluoromethyl)benzoyl chloride (0.534 g) in dichloromethane (2.5 ml) under ice-cooling. After being stirred at the same temperature for 2 hours, the reaction mixture was poured into a mixed solvent of water (40 ml) and dichloromethane (25 ml) and the whole was adjusted to pH 9 with aqueous sodium hydrogen carbonate solution. The organic layer was separated, washed with brine, dried over sodium sulfate and evaporated under reduced pressure. The residue was purified by column chromatography on silica gel (10 g) using a mixed solvent of n-hexane and ethyl acetate (2:1). The fractions containing the objective compound were collected and evaporated under reduced pressure to give 1-[3,5-bis(trifluoromethyl)benzoyl]-4-(benzyloxycarbonyl)-2-(2,3-dimethoxybenzyl)piperazine (0.84 g).
